## **Why does ALPA offer adjustable adapters for digital backs?**

---

Adjustable back adapters (max. 3/10 mm, adjustable in single steps right down to 1/100 mm) with reusable shims of various thickness are exclusive to ALPA. They have been introduced some years ago even though their own components were and are manufactured to the highest degree of precision. The reason? With this they could, and still can, offer a way of ensuring the best tolerance possible from your digital back.

The digital back is not always sacrosanct. Customer problems sometimes only appear when they upgrade their back or have a loan back for some reason. Everything else stays the same but results are different and the customer often does not question the back or the new filter glass etc.

It is always best if one can countercheck with other hardware (other digi back etc.). In such situations the flexibility of the ALPA back adapters provides a sort of insurance policy. We must, however, ask our customers not to rush into changing the adjustments of their ALPA back adapters (for example, to check the workings of the adjusting function). Please see the helpful instructions on YouTube BEFORE attempting any adjustment.
