FLEXICAM

Silvestri presents a new camera specifically designed for digital photography. Our ability in conceiving specific and specialized products has been realized in our new project: the FLEXICAM.

Flexicam is an extremely compact and light camera, suitable for both outdoor and studio photography. Its characteristic compactness and extreme versatility will make it the best choice for architectural and travel photographers. Wide movements and a large range of accessories, flexibility and ease of transport, full compatibility with the Silvestri accessories, large choice of lenses and adapters for digital applications.

New fitting systems for the back accessories, a new extra compact sliding adapter of new concept and a shooting system that allows the use of Hasselblad V lenses have been designed for the Flexicam.

Flexicam is a self-standing system that allows the use of high resolution digital backs: Hasselblad, Imacon, Phase One, Eyelike, Megavision and Leaf and has the standard Silvestri bayonet attachment. Two series of lenses are available; Rodenstock Digital and Schneider Digitar lenses in either Copal or Prontor magnetic shutters with digital control and interface for single shot, multishot and microstep digital backs.

Flexicam achieves good performance with the short focal lengths of the new Schneider 24XL and 35XL lenses that are normally mounted without the need of special recessed mounting.
